Pipelined Implementation
Part 1

CMPU 224 – Computer Organization
Jason Waterman
Real-World Pipelines: Car Washes

- **Sequential**
- **Pipelined**

**Idea**
- Divide process into independent stages
  - Soap, rinse, wax, buff, dry
- Move objects through stages in sequence
- At any given times, multiple objects being processed

**Throughput**
- Number of customers served per unit time

**Latency**
- The time required to service an individual customer
Computational Example

• System
  • Computation requires total of 300 picoseconds
  • Additional 20 picoseconds to save result in register
  • Must have clock cycle of at least 320 ps
3-Way Pipelined Version

- **System**
  - Divide combinational logic into 3 blocks of 100 ps each
  - Can begin new operation as soon as previous one passes through stage A
    - Begin new operation every 120 ps
    - Increase in throughput: \( \frac{8.333}{3.125} = 2.667 \) times
  - Overall latency increases
    - 360 ps from start to finish
    - Increase in latency: \( \frac{360}{320} = 1.12 \) times

Delay = 360 ps
Throughput = 8.333 GIPS (1/120 ps)
Pipeline Diagrams

• Unpipelined

  • Cannot start new operation until previous one completes

• 3-Way Pipelined

  • Up to 3 operations in process simultaneously
Operating a Pipeline

Clock
Limitations: Nonuniform Delays

- Throughput limited by slowest stage
- Other stages sit idle for much of the time
- Challenging to partition system into balanced stages

Delay = 510 ps (450 + 60)
Throughput = 5.88 GIPS (1/170 ps)
Limitations: Register Overhead

- As try to deepen pipeline, overhead of loading registers becomes more significant
- Percentage of clock cycle spent loading register:
  - 1-stage pipeline: 6.25%
  - 3-stage pipeline: 16.67%
  - 6-stage pipeline: 28.57%
- High speeds of modern processor designs obtained through very deep pipelining (15 or more stages)
Data Dependencies

- System
  - Each operation depends on result from preceding one
Data Hazards

• Result does not feed back around in time for next operation
• Pipelining has changed behavior of system
Data Dependencies in Processors

- Result from one instruction used as operand for another
  - Read-after-write (RAW) dependency
- Very common in actual programs
- Must make sure our pipeline handles these properly
  - Get correct results
  - Minimize performance impact

```
1  irmovq $50, %rax
2  addq %rax, %rbx
3  mrmovq 100(%rbx), %rdx
```
SEQ Hardware

• Stages occur in sequence
• One operation in process at a time
SEQ+ Hardware

- Still sequential implementation
  - Reorder PC stage to put at beginning

- PC Stage
  - Task is to select PC for current instruction
  - Based on results computed by previous instruction

- Processor State
  - PC is no longer stored in register
  - But, can determine PC based on other stored information
Pipeline Stages

- **Fetch**
  - Select current PC
  - Read instruction
  - Compute incremented PC
- **Decode**
  - Read program registers
- **Execute**
  - Operate ALU
- **Memory**
  - Read or write data memory
- **Write Back**
  - Update register file
Pipeline Demonstration

irmovq  $1,%rax  #I1
irmovq  $2,%rcx  #I2
irmovq  $3,%rdx  #I3
irmovq  $4,%rbx  #I4
halt    #I5

Cycle 5
PIPE- Hardware

- Pipeline registers hold intermediate values from instruction execution
- Forward (Upward) Paths
  - Values passed from one stage to next
  - Cannot jump past stages
    - e.g., valC passes through decode
Signal Naming Conventions

- **S_Field**
  - Value of Field held in stage S pipeline register
- **s_Field**
  - Value of Field computed in stage S
Feedback Paths

• Predicted PC
  • Guess value of next PC

• Branch information
  • Jump taken/not-taken
  • Fall-through or target address

• Return point
  • Read from memory

• Register updates
  • To register file write ports
Data Dependencies: No Nop

0x000: `irmovq $10, %rdx`

0x00a: `irmovq $3, %rax`

0x014: `addq %rdx, %rax`

0x016: `halt`

Cycle 4

M

M_\text{valE} = 10
M_\text{dstE} = %rdx

E

e_\text{valE} \leftarrow 0 + 3 = 3
E_\text{dstE} = %rax

D

valA \leftarrow \text{R}[%rdx] = 0
valB \leftarrow \text{R}[%rax] = 0

Error
Data Dependencies: 1 Nop

0x000: irmovq $10, %rdx
0x00a: irmovq $3, %rax
0x014: nop
0x015: addq %rdx, %rax
0x017: halt

Cycle 5

D
valA ← R[%rdx] = 0
valB ← R[%rax] = 0

M
M_valE = 3
M_dstE = %rax

W
R[%rdx] ← 10

Error
Data Dependencies: 2 Nop’s

0x000: irmovq $10, %rdx
0x00a: irmovq $3, %rax
0x014: nop
0x015: nop
0x016: addq %rdx, %rax
0x018: halt
Data Dependencies: 3 Nop’s

0x000: irmovq $10, %rdx
0x00a: irmovq $3, %rax
0x014: nop
0x015: nop
0x016: nop
0x017: addq %rdx, %rax
0x019: halt

Cycle 6

W
R[%rax] ← 3

Cycle 7

D
valA ← R[%rdx] = 10
valB ← R[%rax] = 3
Data Dependencies: NOPs

• The problem is a RAW (Read After Write) dependency
• Read values from the register in the decode stage
• Registers are not updated until the write-back stage
  • 3 cycles later
• One solution
  • Make sure registers that are written are not read until after 3 cycles has passed
  • Can insert NOPs between the instructions to insure correct behavior
• This can be very error-prone
  • We’ll fix this later
  • Have the processor detect and correct this situation
Predicting the PC

- Start fetch of new instruction after current one has completed fetch stage
  - Not enough time to reliably determine next instruction
- Guess which instruction will follow
  - Recover if prediction was incorrect
Our Prediction Strategy

• Instructions that do not transfer control
  • Predict next PC to be \texttt{valP}
  • Always reliable

• Call and unconditional jumps (\texttt{jmp})
  • Predict next PC to be \texttt{valC} (destination)
  • Always reliable

• Conditional jumps
  • Predict next PC to be \texttt{valC} (destination)
  • Only correct if branch is taken
    • Typically right 60\% of time

• Return instruction
  • Do not try to predict
Recovering from PC Misprediction

- **Mispredicted Jump**
  - Will see branch condition flag once instruction reaches memory stage
  - Can get fall-through PC from `valA (value M_valA)`

- **Return Instruction**
  - Will get return PC when ret reaches write-back stage (`W_valM`)
Pipeline Summary

• Concept
  • Break instruction execution into 5 stages
  • Run instructions through in pipelined mode

• Limitations
  • Data dependencies
    • One instruction writes register, later one reads it
  • Control dependency
    • Instruction sets PC in way that pipeline did not predict correctly
    • Mispredicted branch and return

• Fixing the pipeline
  • We’ll do that next time
